

## Preserving SR 410: Fixing the Worst Spot First

410

### Milepost 41.4 - 42.0

This section is the most vulnerable stretch of highway outside of Mt. Rainier National Park to floods during the spring melt and fall rains. We will elevate the highway and improve culverts to allow water to flow under the road during high water levels. We will also install log jams to deflect the river away from the bank along the roadway.
